Wager & Risk Management — SCL Season 2 Guide

Section-C Cricket League · Operational Protocol

SCL's prediction market is a **pooled Yes/No market**. It is not a bookmaker: stakes are pooled, odds are set by consensus probability, and the **House (league administration) guarantees fair payouts** so a thin market never cheats the winner.

1. How the market works

- Every market asks a **Yes/No question** — e.g. ****Will Thunder win Match 5?****
- Everyone stakes into one of **two pools: Yes or No**.
- Stakes are **not matched 1-to-1**. All the money pools together, and at resolution the

winning side splits the pot. - The league administration (the **House**) acts as the **liquidity provider of last resort** — see the House Guarantee below.

2. The lifecycle of a wager

`` Propose → Calibration → Financial veto → Peer phase → Resolution ■ voided ``

2.1 Propose

A player (or manager) proposes a condition and places the **first stake** — this opens the market. The proposer's stake starts the pool.

2.2 Calibration

Admins assign an **objective probability** to the condition (e.g. "Thunder has a 40% chance"). Multiple admins give **blind estimates**; if they disagree, the **mathematical average** is used. This locks the **fair odds**:

- fair odds for a side = $100 \div \text{probability (as a percentage)}$.
- E.g. a 40% side pays **2.5x**; a 25% underdog pays **4x**.

2.3 Financial veto

A mandatory solvency check — if the market would **risk a club's long-term participation** (bankruptcy, inability to enter the next draft), the market is **vetoed and every stake refunded 100%**.

2.4 Peer phase (betting open)

Other players enter the **Yes or No** pools. The market is now **vett**ed and open for staking. You can stake any amount you have in liquid cash; a live preview shows exactly what you'd win.

*The House guarantee (automatic). If peer interest is too thin to pay the risk-adjusted payout (e.g. the 4x underdog wins but the pot is small), the House automatically tops up so the winner gets their full fair-odds payout. You will see this live on every market: ****House covers: Yes win → N · No win → M**** — it updates the moment anyone stakes, on*

either side.

2.5 Resolution

The admin resolves with the **winning side**:

- Winners receive **at least stake × fair odds** (the House covers any shortfall), and if the pot is fat they split **everything** pro-rata (which can pay more than fair odds). - Losers' stakes fund the pot. - Payouts land in your **liquid cash** automatically.

2.6 Void

Ambiguous, impossible, or integrity-compromised markets are **voided** — **100% refunds** to everyone.

3. Financial solvency (bankruptcy veto)

- **The rule**: admins reserve absolute authority to **cap or cancel** any wager that threatens a club's long-term participation. - **The trigger**: if a stake risks immediate bankruptcy, or would leave a club unable to participate in the upcoming draft, intervention is **mandatory**. - When it happens: the market is vetoed and **all stakes are refunded**.

4. Integrity & anti-fraud

- **Match-fixing & collusion** are monitored continuously — suspicious gameplay or unnatural betting volumes are flagged. - If integrity is compromised: the market is **voided immediately** and **all stakes are refunded**. - Calibration is blind and averaged specifically so no single admin can game the odds.

5. Operational edge cases

Situation	What happens
Ambiguous / impossible condition	Market voided — 100% refunds
Mid-wager news breaks (injury, weather, lineup)	Pools are frozen ; a Phase 2 market may open with updated odds
Admins disagree on risk	Mathematical average of blind estimates is used
Nobody bets the winning side	Market is voided rather than resolved (per platform rules)
House can't cover the guarantee	Resolution is blocked until House funds are topped up by admin

6. Playing on the platform

- **Board** (/wagers) — every market as a card: pools, pot, fair odds, and the live **House guarantee chip**. - **Detail** (/wagers/<id>) — full pool visual, the House guarantee banner, the stake form with the live "you'd win X" preview, and every bet + lifecycle event. - **Propose** — from the board, open a market with your first stake. - **Stake** — only on **vetted** markets; uses your **liquid cash** (auto mode holds money in the vault, so switch it off to stake).

Status chips: proposed → calibrating → vetted (open) → frozen → resolved / voided.
